One-step Actor-Critic (episodic), for estimating $\pi_{\theta} \approx \pi_*$

Input: a differentiable policy parameterization $\pi(a|s,\theta)$

Input: a differentiable state-value function parameterization $\hat{v}(s,\mathbf{w})$ Parameters: step sizes $\alpha^{\theta} > 0$, $\alpha^{\mathbf{w}} > 0$

Initialize policy parameter $\boldsymbol{\theta} \in \mathbb{R}^{d'}$ and state-value weights $\mathbf{w} \in \mathbb{R}^{d}$ (e.g., to 0) Loop forever (for each episode):

 $S \leftarrow S'$

Initialize
$$S$$
 (first state of episode)

Loop while
$$S$$
 is not terminal (for $A \sim \pi(\cdot|S, \theta)$

 $\delta \leftarrow R + \gamma \hat{v}(S',\mathbf{w}) - \hat{v}(S,\mathbf{w})$ $\mathbf{w} \leftarrow \mathbf{w} + \alpha^{\mathbf{w}} \ \delta \nabla \hat{v}(S, \mathbf{w})$ $\boldsymbol{\theta} \leftarrow \boldsymbol{\theta} + \alpha^{\boldsymbol{\theta}} \ \delta \nabla \ln \pi(A|S, \boldsymbol{\theta})$

Loop while
$$S$$
 is not terminal (for each time step):

Take action A, observe S', R

Loop while
$$S$$
 is not terminal (for each time step): $A \sim \pi(\cdot|S, \boldsymbol{\theta})$

Loop while S is not terminal (for each time step):

(if
$$Cl$$
 is terminal than $\hat{x}(Cl, \dots)$: 0)

erminal, then
$$\hat{v}(S',\mathbf{w}) \doteq 0$$

(if
$$S'$$
 is terminal, then $\hat{v}(S', \mathbf{w}) \doteq 0$)

$$',\mathbf{w}) \doteq 0)$$
